

Installation of django (for window and mac)

Step 1: Create a Virtual Environment

First, we need to create a virtual environment to manage project dependencies separately.

Command:

python -m venv myenv (Windows)

(or)

py -m venv myenv (windows)

python3 -m venv myenv (mac)

Here, **env** is the name of the virtual environment folder.

Step 2: Activate the Virtual Environment

Navigate to the **Scripts** folder and activate the environment.

Commands (**Windows**):

myenv\Scripts\activate

Commands (**Mac Book**):

Source myenv/bin/activate

After activation, (**myenv**) will appear before the command prompt.

Step 3: Install Django

Install Django inside the virtual environment.

pip install django (Windows)

pip3 install django (MAC)

To check the Django version:

django-admin --version

Creating a Django Project

Step 4: Start a New Project

Use the following command to create a Django project.

django-admin startproject project_name

Example:

django-admin startproject myproject

This will create a project folder named **myproject**.

Use **code .** to open the vscode

Opening the Project in Terminal

Step 5: Open Terminal in the Project Folder

1. Click **Open in Terminal (Command Prompt here)**.
-

Running the Django Server

Step 6: Run the Development Server

Use the following command to start the Django server.

python manage.py runserver (windows)

python3 manage.py runserver (mac)

After running this command, you will see something like:

Starting development server at ***http://127.0.0.1:8000/***

Open your browser and go to:

<http://127.0.0.1:8000/>

You will see the **Django Welcome Page**, which means the server is running successfully.

Summary Flow

1. Create Virtual Environment
2. Activate Environment
3. Install Django
4. Create Project
5. Open Terminal in Project Folder
6. Run Server using `python manage.py runserver`
